

RenderedHTMLDiff_Electron

English | [日本語](#)

An Electron-based desktop app for visualizing differences between two HTML files. Select two HTML files and visualize rendered text differences with color highlights.

Features

- GUI-based file selection for `old.html` and `new.html`
- Generate differences for the text content actually rendered in the browser, rather than for the HTML source code.
- Character-level text diff highlighting
- Instant preview in an embedded `iframe`
- Save the diff result as an HTML file

Highlight rules:

- Inserted text: green background
- Deleted text: red background with strikethrough

Requirements

- Node.js 18+
- npm
- Windows/macOS/Linux (Electron-supported environments)

Setup

```
npm install
```

Run

```
npm start
```

Usage

1. Click Choose in **Old HTML** and select the original file.
2. Click Choose in **New HTML** and select the updated file.
3. Click Generate Diff to build and preview changes.
4. Click Save as HTML to export the diff result.

The default output filename is `diff_output.html`.

Dependencies

- [cheerio](#)
- [diff](#)

Known Limitations

- The implementation focuses on text-node differences.
- Large structural/layout changes may not always place highlights where users expect.
- Text under `script`, `style`, and `noscript` is excluded from diff processing.

Data Collection

This app does not collect any personal information or user data.

How Processing Works

The HTML files selected by the user are processed inside the app. Rendering and diff processing are completed locally, and no data is sent to external servers.

External Service Access

This app does not transmit user data to external services.

Cookies and Tracking

This app does not use cookies, local storage, or tracking technologies.
